“Veta la Palma” lagoon. Seville-Andalusia.

The Veta la Palma lagoon with more than 10.000 hectares, and is an ecosystem of high ecological value mainly linked to the Guadalquivir river and where they develop in a compatible way activities such as agriculture, livestock, fisheries and aquaculture, while maintaining natural conditions suitable for nesting and the presence of a large community of birds.

General Fisheries Commission for the Mediterranean
Commission Générale des Pêches pour la Méditerranée

LaMed-2 Project

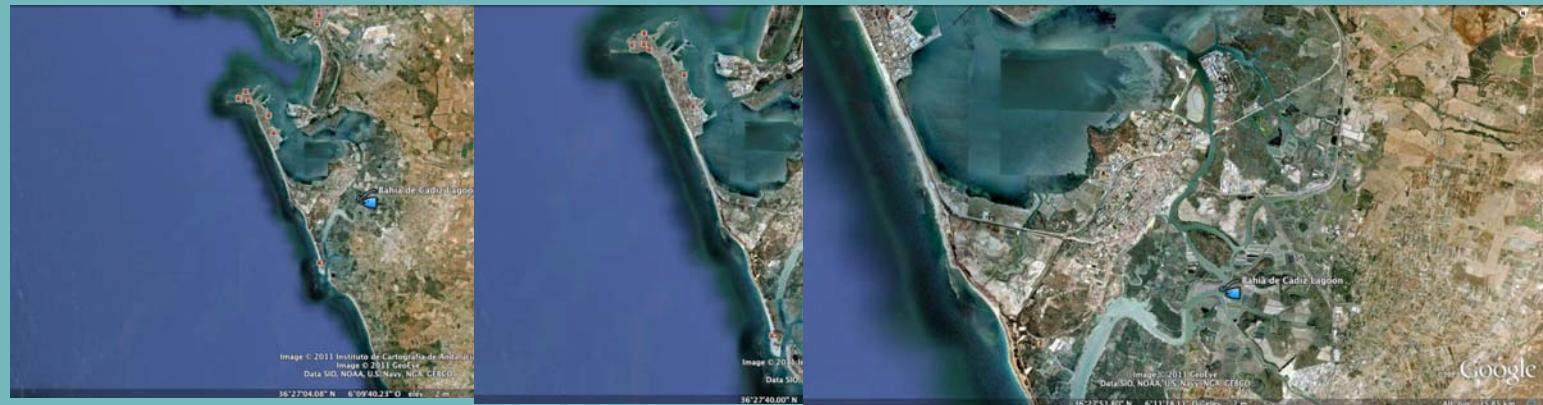

“Veta la Palma” lagoon. Seville-Andalusia.

Lagoons in Cadiz Bay. Cadiz-Andalusia.

- It is an area with tidal influence of a high degree of transformation and saltmarsh were formerly for the production of salt.
- The Bay of Cadiz is protected as natural park and includes a sea area and another area of marsh that is flooded with the influence of the tides.
- This structure of canals, ponds, etc, has been maintained over time and has been transformed into aquaculture facilities, some of them to extensive production and other semi-intensive.

General Fisheries Commission for the Mediterranean
Commission Générale des Pêches pour la Méditerranée

LaMed-2 Project

Lagoons in Cadiz Bay. Cadiz-Andalusia.

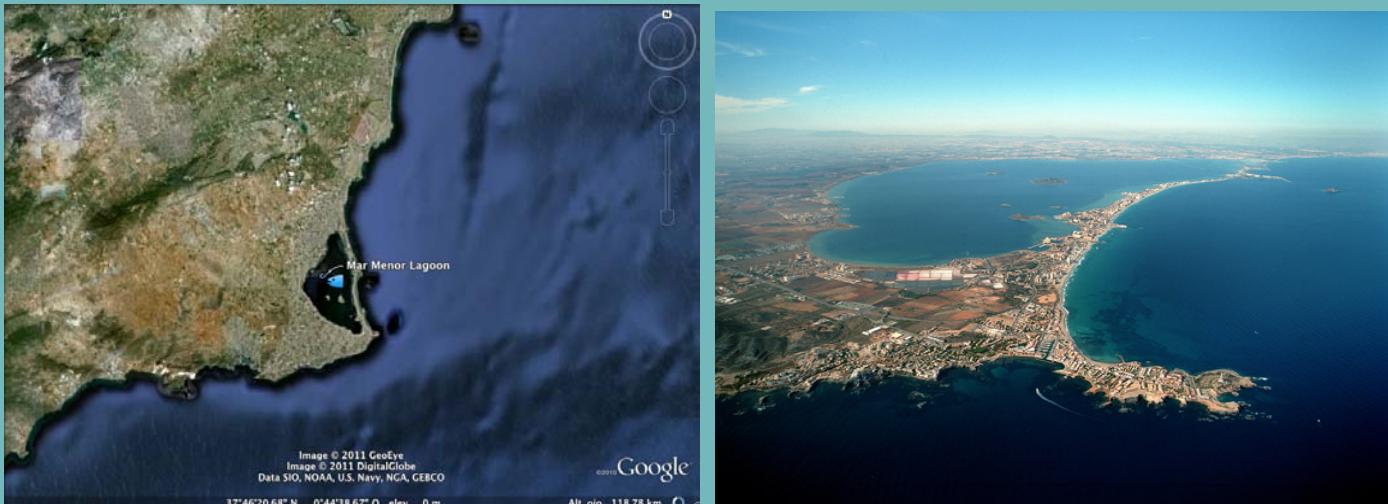

In this area aquaculture is the engine of local development and fishing is an residual activity with little control. In fact there are no data on fishing catches in the area.

“Mar Menor”. Cartagena-Murcia.

- The Mar Menor is an ancient flood basin that has formed a hypersaline coastal lagoon. Is protected as a Ramsar site.
- This lagoon is surrounded by a set of activities such as agriculture, industries, housing estates, etc, but especially a very large urban development that threatens the environmental sustainability of the area.
- Fishing is almost nonexistent, only given a artisanal fishing (mullets) and particularly sport fishing. Meanwhile, aquaculture does not exist in the area.

General Fisheries Commission for the Mediterranean

LaMed-2 Project

“Mar Menor”. Cartagena-Murcia.

“Albufera de Valencia”

The Albufera of Valencia is a shallow coastal lagoon (average depth of 1 m) on the Mediterranean coast south of the city of Valencia.

It covers an area of 23.94 square kilometers and is surrounded by 223 km² of rice fields.

Separated from the sea by a narrow sand barrier and where sand dunes have been stabilized by a pine forest.

“Albufera de Valencia”

- The Albufera is a staging post for many species of migratory birds.
- Its ecological value is great because here are important species in danger of extinction, such as fartet (*Aphanius iberus*) or samaruc (*Valencia hispanica*), both are Cyprinidae family.
- Today, as a result of the overexploitation and pollution of the waters, fishing is only maintained through the mullets. The other two species, eel and sea bass have been phased out.

LaMed-2 Project

“Albufera de Mallorca”.

“Albufera de Mallorca”.

The Albufera of Majorca is the largest wetland area and most important of the Balearic Islands.

It is a lagoon separated from the sea by a set of dunes, which for many centuries and human influence has been filled with sediments into a broad floodplain.

“Albufera de Mallorca”.

The natural park of Albufera de Mallorca gives protection to some 1708 hectares of marsh and dunes.
Has a high diversity of vegetation, fish and birds.

The fishing is almost nonexistent, only to give demonstrations of traditional crafts for fishing eel and mullets and aquaculture in the area near there.

“Delta del Ebro” lagoon. Catalonia.

The Ebro delta is the largest wetland in Catalonia and one of the largest in Western Europe.

Currently facilities large hydroelectric dams on the river has slowed the growth of the Delta and coastal erosion is greater than the sediments deposited by river.

These problems must be added the collapse of the delta, saline intrusion, the introduction of the new issue of transfers, the decline in Ebro River, the accumulated pollutants, etc.

“Delta del Ebro” lagoon. Catalonia.

The Ebro Delta is composed of a set of geomorphologic elements, among which are 8 lagoons. Of these we selected the two largest (Lencanysada and Calaixos de Buda).

Economic activities include agriculture (mainly rice), fishing, aquaculture and tourism with a total annual economic value of about 100 million Euros. The fishing is done is artisanal fixed gear and species such as eels, mullet, etc, and also makes sport fishing.

In the area there are some aquaculture farms on both the inland and other experiences at sea.

LaMed-2 Project

emerging problems

- Pollution waters.
- Disruption of water regime.
- Grounding of the marsh.
- Urbanism in the dune system.
- Industrial pressure around.
- Hunting in the parks.
- Impacts of infrastructure.
- The increased pressure from tourism and recreation.

development perspectives and interventions by the public administration

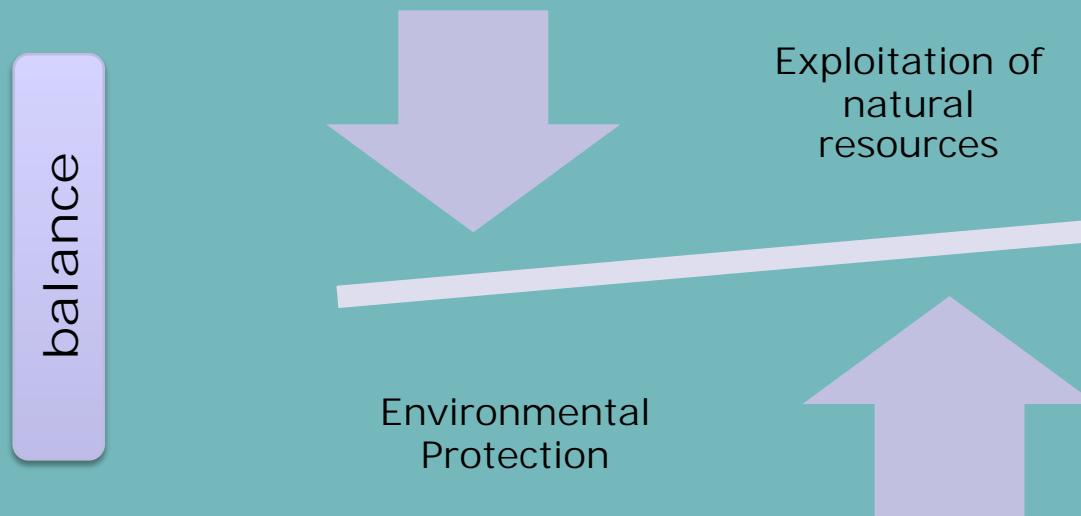

Administrative competences:

- Regional Ministry of Environment: All Lagoons areas considered, are place in the Public Maritime Domain (except Veta la Palma) so under an Environment "figure" of Protection.
- Regional Ministry of Agriculture and Fisheries: Artisanal and sport fishing takes place as well as aquaculture, but there is a lack of combined management of resources.
- Regional Ministry of Tourism: Different users of the Lagoons coexist on the same environment.

Preliminary conclusion

There is a need of intervention from all administrative bodies in coordination with all the users of the space to achieve an Integrate Lagoons Management using an ecosystem approach.
