

Harmful benthic algal species in the Mediterranean Sea: genetic diversity and ecological aspects

Antonella Penna

Environmental Biology, Dep. Biomolecular Sciences,
University of Urbino, Italy
email: antonella.penna@uniurb.it

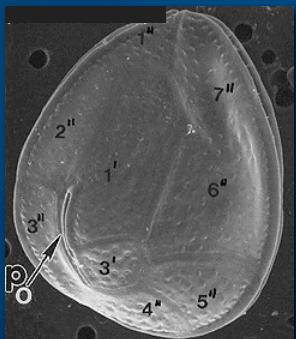

benthic *Ostreopsis* species

O. lenticularis

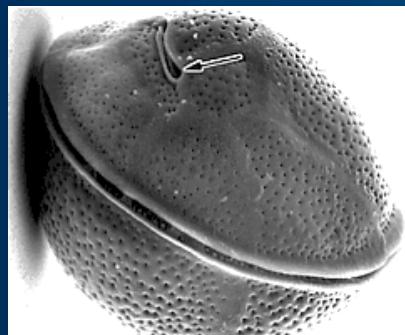

O. cf. ovata

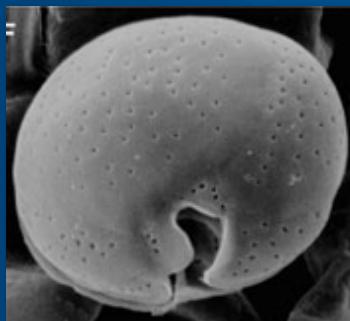

O. labens

Order Gonyaulacales
Family Ostreopsidaceae Lindeman (1928)
Genus *Ostreopsis* Schmidt (1901)

benthic *Coolia* species

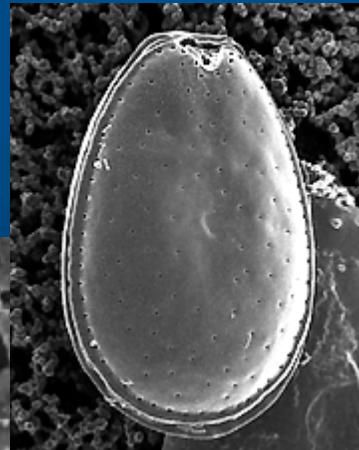

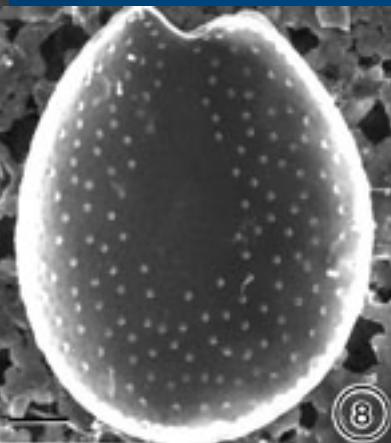

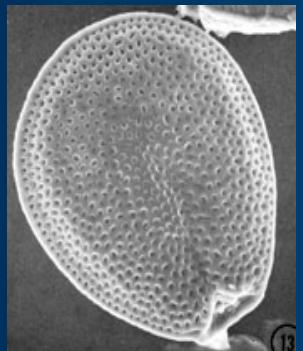

Coolia monotis

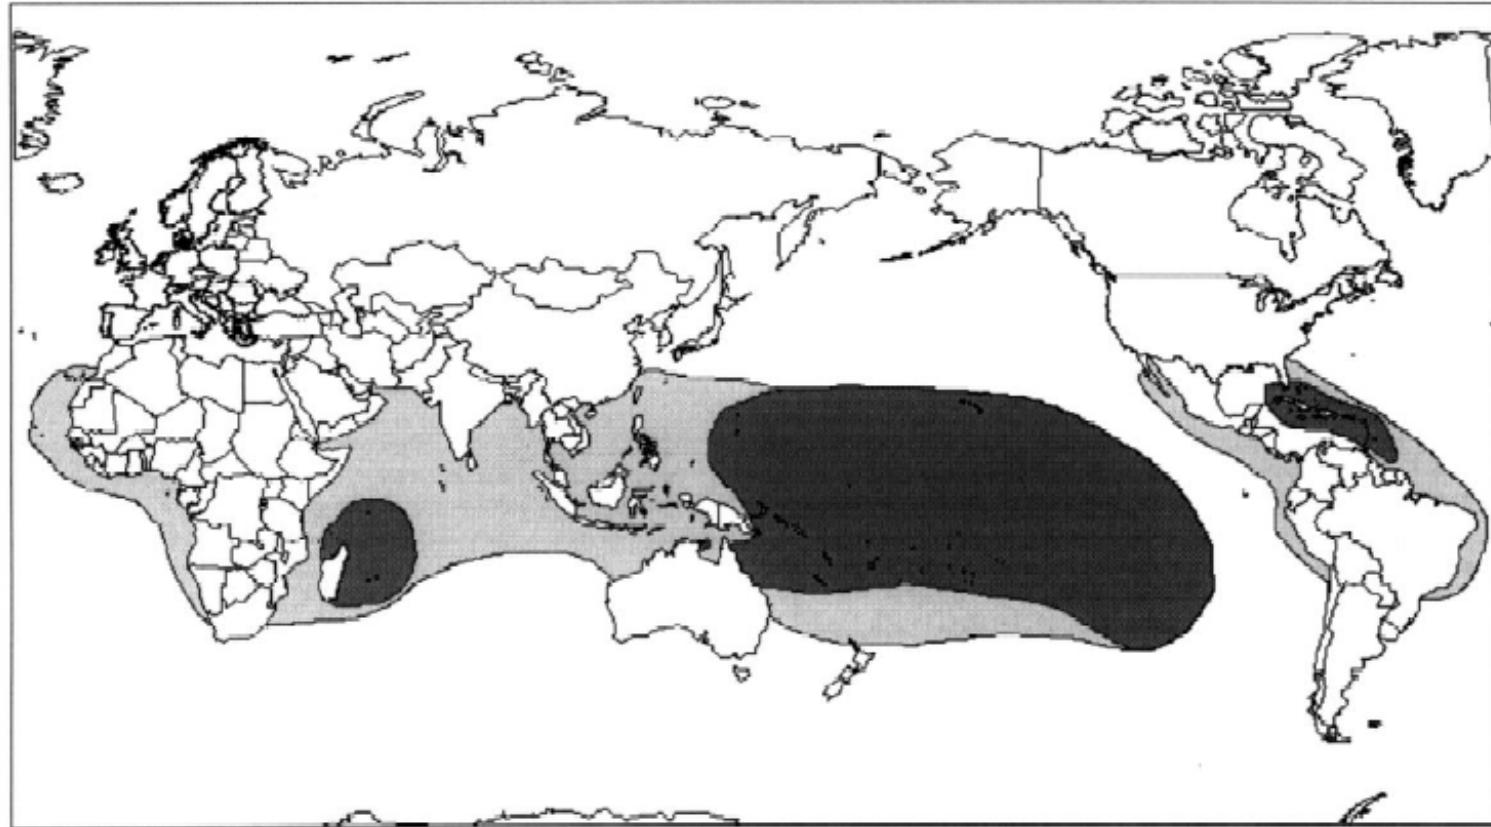

Coolia malayensis

Order Gonyaulacales
Family Ostreopsidaceae Lindeman (1928)
Genus *Coolia* Meunier (1919) Balech (1956)

benthic *Prorocentrum* species

Order Prorocentrales
Family Prorocentraceae
Genus *Prorocentrum* (Ehrenberg)

Geographical distribution of the endemic Ciguatera in the world

Lehane and Lewis, 2000

Ciguateric Dinoflagellate species and their respective toxins

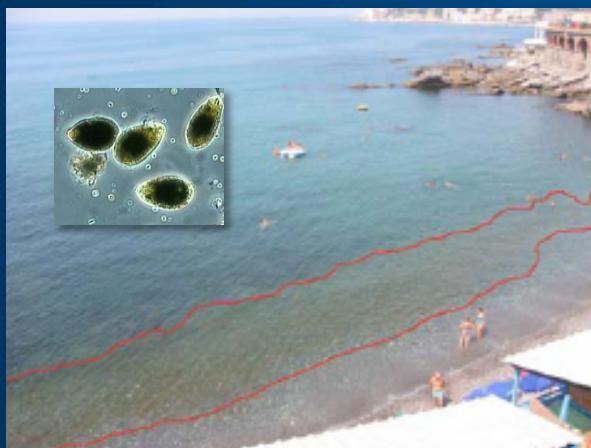

SPECIES	TOXINS	References
<i>Amphidinium carteri</i>	Hemolysins 1-5	Yasumoto et al. 1987
<i>Coolia monotis</i>	unnamed	Nakajima et al. 1981
<i>Gambierdiscus toxicus</i>	Ciguatoxins Maitotoxins	Yasumoto et al. 1977 Yokoyama et al. 1988
<i>Ostreopsis heptagona</i>	unnamed	Norris et al. 1985
<i>Ostreopsis lenticularis</i>	Ostreotoxin unnamed	Tindall et al. 1990 Ballantine et al. 1988
<i>Ostreopsis cf. ovata</i>	OVTX a, b,c,d,e	Ciminello et al. 2006; 2010 Rossi et al. 2010
<i>Ostreopsis cf. siamensis</i>	Ostreocin D	Ukena et al. 2001
<i>Prorocentrum lima</i>	FAT Okadaic acid Prorocentrilide	Tindall et al. 1990 Murakami et al. 1982 Torigoe et al. 1988

- *Ostreopsis* is a benthic dinoflagellate which produces potent biotoxins
- The genus *Ostreopsis* has recently been receiving greater attention from researchers and public authorities, since its proliferation has been associated with human intoxication by toxic aerosols along the western Mediterranean coasts

NEW INVASIVE SPECIES IN THE MEDITERRANEAN SEA

Toxic Benthic Dinoflagellates

Invasive high density species
abundance $10^5 - 10^6$ cells g fw $^{-1}$

- *Ostreopsis* spp. occurrence summer-autumn periods
- Epiphytic on soft and hard substrata
- Blooms with toxic aerosol
- High biomass proliferation, biofilm or mucilage
- Human intoxication
- Water quality deterioration
- Benthic communities suffering or mortalities
- Bivalve PLTX - contamination

Oceanic Climate Change

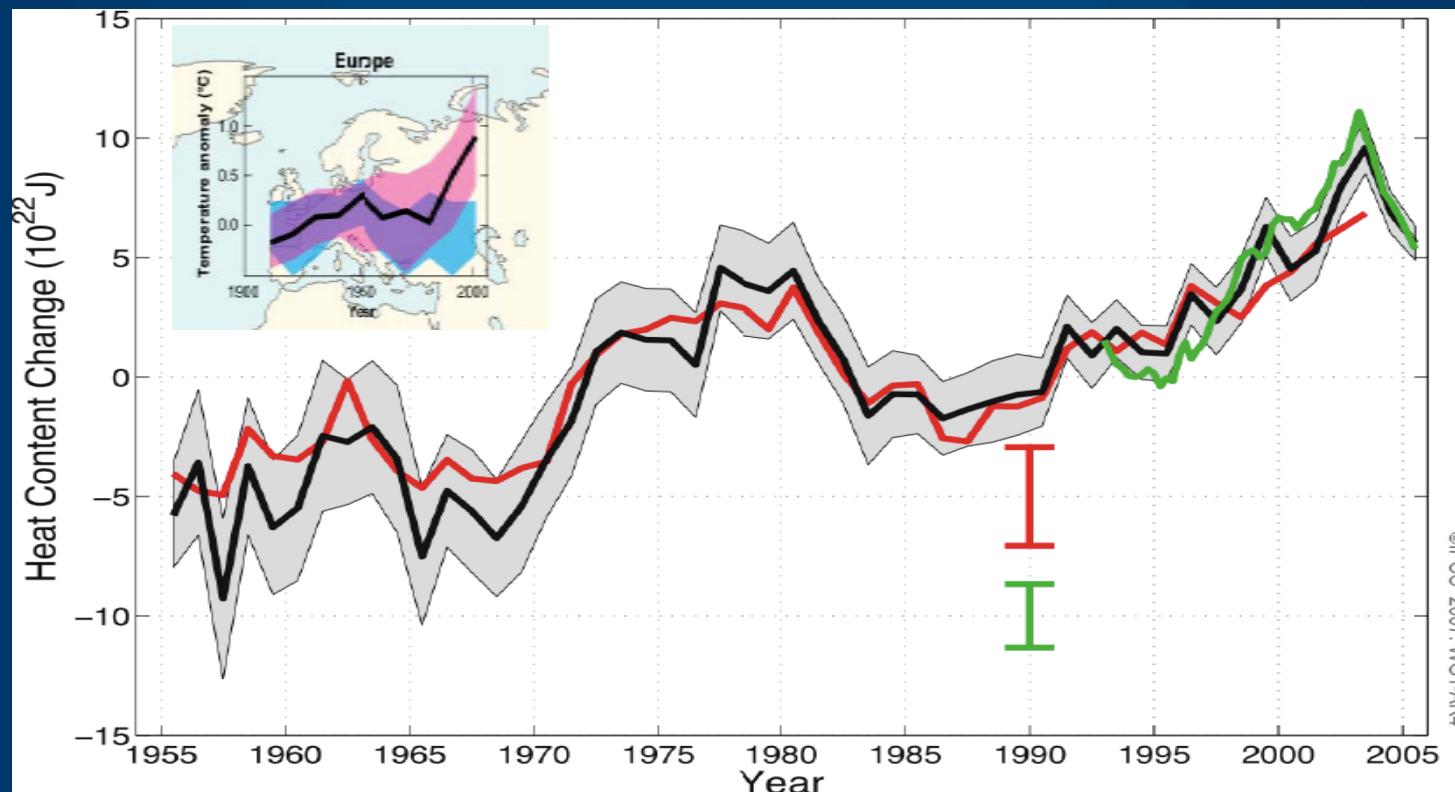

- Changes in Ocean Salinity, Temperature, Heat Uptake, Heat Content
- Biogeochemical Tracers
- Changes in Ocean Circulation and Water Mass Formation

Increase in sea water temperature

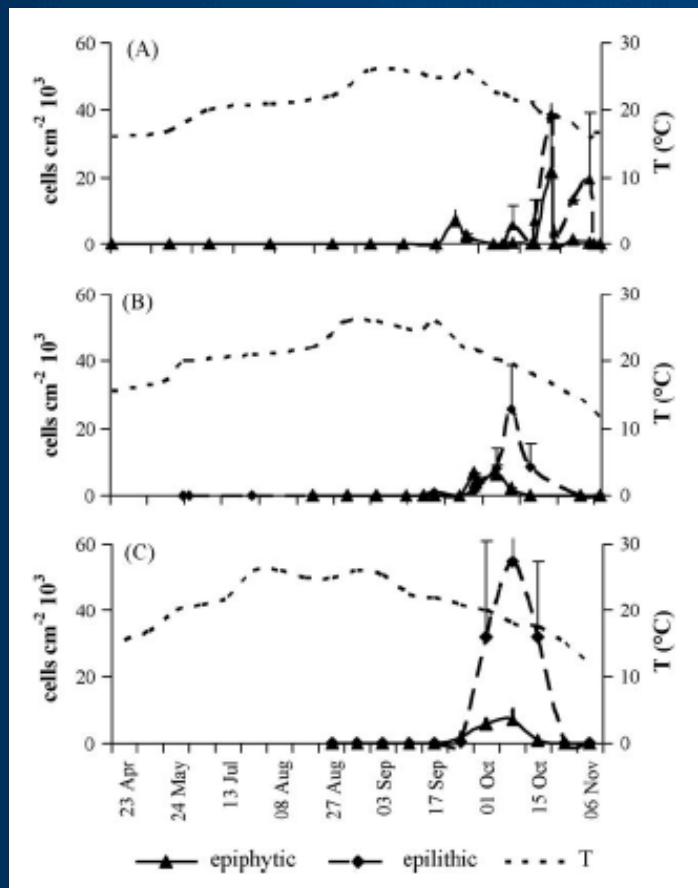

CIGUATERA

- Expansion in distribution of warm water species (Mediterranean Sea)
 - Ciguatera and coral bleaching (tropical/subtropical areas)

Ocean heat content increasing

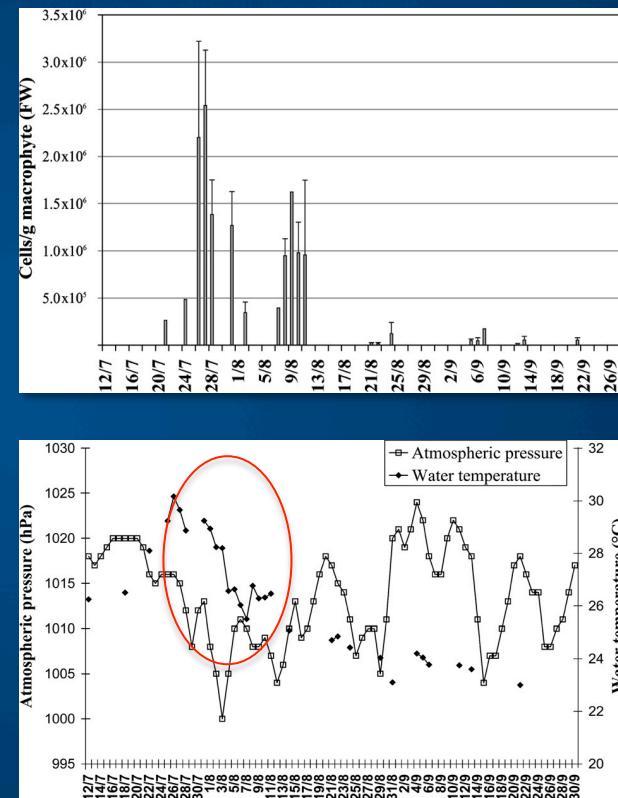

Ostreopsis cell concentration and temperature trends
at Conero Riviera during summer 2007
Adriatic Sea

Totti et al. 2010 Harmful Algae

Ostreopsis cell concentration at
Genova coastline during summer 2006
Tyrrhenian Sea

Few identified genetic species as

O. cf. ovata,
O. cf. siamensis,
O. lenticularis,
O. labens

were analysed based on the phylogeny and nucleotide diversity at inter and intra species level at the Mediterranean area.

Phylogenetic analyses within genus

ML tree ITS-5.8S rDNA

Penna et al. *J. Phycol.* 2005

Morphological and morphometric characters are highly variable in cultured specimens and field material

- Previous morphological observations of Mediterranean isolates fitted well with the original description of *O. ovata* by Fukuyo and *O. siamensis* by Schmidt.
- Phylogenetic analyses based on 5.8S rDNA and ITS confirmed the clustering of isolates in two distinct species in the Mediterranean Sea.
- Mediterranean/Atlantic clade of *O. cf. ovata* is well separated from Asian clade.
- Mediterranean/Atlantic and Asian clades of *O. cf. ovata* evolved independently based on the molecular diversity index.

BENTOX-NET is a network of Italian researchers with sound experience in the study of phytoplankton blooms, including those caused by harmful and toxic microalgae. Expertise is also available in the fields of marine macroalgae, ecology of planktonic and benthic ecosystems and algal toxins. The network aims at improving knowledge on all aspects of Harmful Benthic Algae blooms (HBAB).

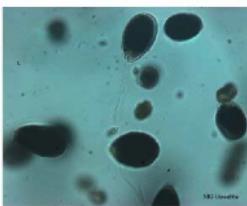

These phenomena have rather unique, but still scarcely known, features. Their impact on the marine ecosystem and human health can be significant. Since 1998, the requirement of intervention by public officers and scientists has been increasing alarmingly.

Blooms of *Ostreopsis* spp. do not seem to follow the same trends of other blooms, thus leaving many open questions as to their short and long term management activity.

It is therefore urgent to improve the provisional and protection strategies in the coastal areas where these blooms occur, especially in cases of particular high intensity and impact risk (health and economic). To this end, it is also important to identify the areas and periods of the year of high risk, in order to be able to mitigate problems and implement adequate plans to protect human health and coastal marine environments.

Adequate management of environmental and public health emergencies caused by Harmful Algal Blooms requires a thorough knowledge of these phenomena and their consequences. BENTOX-NET is a tool to optimise the use of the available knowledge, through a rapid dissemination of the relevant information. The aim is to organise a national multidisciplinary research program to quickly provide the information to better manage the problems caused by HBABs. The gathered information will include the distribution, ecology and physiology of the responsible organisms.

Some conclusions on benthic harmful algae:

- *Ostreopsis* spp. is not an alien or introduced species into Mediterranean Sea
- *Ostreopsis* is probably an hidden flora along the coasts
- *Ostreopsis* could start blooming under an internal clock and synchronizing environmental factors during recent years
- *Ostreopsis* can be a successful species and blooms under favourable conditions or season competing with the other benthic species (diatoms)

Gambierdiscus sp. nov.: new first record of Ciguateric species in the Mediterranean Sea

- Relatively low abundance levels (<100 cells g⁻¹ fwm)
- Found epiphytically on phaeophytes and rhodophytes
- Detected in Greek waters (South and South East Aegean, Cretan Sea, in summer and autumn months)

Gaps in knowledge:

- resting cysts?
- Is the Mediterranean *Gambierdiscus* an invasion in the Med Sea? **OR**
- It has always been around as a different, more temperate species than the known tropical ones?
