Total	1190		337	33300		2000	

Legal minimum size	
--------------------	--

Comments

The number of licensed vessels ranged between 1100 and 1500 during the period from 1997 to 2008. The mean annual pandora landing is 250 tons (1997-2008) . The discard means the undersized species, species of lesser commercial important, unidentified species and species which rarely appear. The mentioned values are the mean of two years 2007-2008.

Sheet Z

Objectives and recommendations

Code: PAC2610Sah

Management advice and recommendations*

Fishing mortality should be reduced by about 40-60% to achieve F0.1.
Mesh sizes should be regulated.
Nursery grounds should be identified and protected from illegal fishing techniques.

Advice for scientific research*

ADVICE FOR SCIENTIFIC RESEARCH

With possible support of regional projects

The necessity to work in order to provide a common management information system for the Mediterranean countries.

The necessity to standardize the stock assessment methods to facilitate the comparison between species in different areas.

It is necessary to make an accurate data base about our fisheries involving good records for fishery statistics.

Abstract for SCSA reporting

Authors Sahar Fahmy Mehanna **Year** 2010

Species Scientific name Pagellus erythrinus - PAC
Source: GFCM Priority Species

Source: -

Source: -

Geographical Sub-Area 26 - South Levant

Fisheries (brief description of the fishery)*

The number of licensed trawl vessels ranged between 1100 and 1500 during the period from 1997 to 2008.

This fleet targets many species such as red mullet, *Mullus surmuletus* and *M. barbatus*; the sparids, *Sparus aurata*, *Pagellus* spp., *Boops boops*, *Lithognathus mormyrus*, *Diplodus* spp.; the soles, *Solea* spp.; the European hake, *Merluccius merluccius*; the picarels, *Spicara* spp.; the lizardfishes, *Synodus saurus*; the cephalopods, *Sepia* spp., *Loligo* spp. and *Octopus* spp.; crabs, *Portunus pelagicus* and shrimp which represented by about 10 species.

The vessel length varied between 18 and 22 m and its width varied from 4 to 6 m. Each vessel is powered by main engine of 150 to 600 hp but the majority of 250 hp engine. The fishing trip is about 7 to 10 days and the number of crew is about 6 to 15 persons.

The mean annual landing of trawl fishery is around 17 thousand tons accounting for approximately 33% of total catches in Egyptian Mediterranean.

Source of management advice*

(brief description of material -data- and methods used for the assessment)

The fish samples were collected monthly from the trawl fishery during two years (2007-2008). Also, some of these samples were collected from local markets.
Age and growth was done based on the scale's readings
The growth parameters (L_{∞} , k and t_0) were estimated following the Von Bertalanffy growth curve
The length at first capture (L_c) was estimated from the catch curve analysis
The length at first sexual maturity (L_m) was estimated by fitting the maturation curve between the observed points of mid-class interval and the percentage maturity of fish corresponding to each length interval.
The yield per recruit (Y/R) analysis was performed using VIT software and Beverton and Holt model
The total mortality coefficient (Z) was estimated using the converted catch curve and VPA
The natural mortality coefficient was estimated according to Djabali et al. (1993).

Stock Status*

O - Overexploited. The fishery is being exploited at above a level which is believed to be sustainable in the long term, with no potential room for further expansion and a higher risk of stock depletion/collapse;

Exploitation rate

Stock abundance

High fishing mortality
