Legal minimum size	
--------------------	--

Comments

Bogue in GSA 25 is exploited mainly by the artisanal fleet using set nets (basically gill nets), with other semi demersal species such as *Spicara smaris* and *Spicara maena*. The percentage from the overall landings of the species is 92.5% and 7.5% for each gear respectively. It is obvious that is mainly exploited by the artisanal fishery.

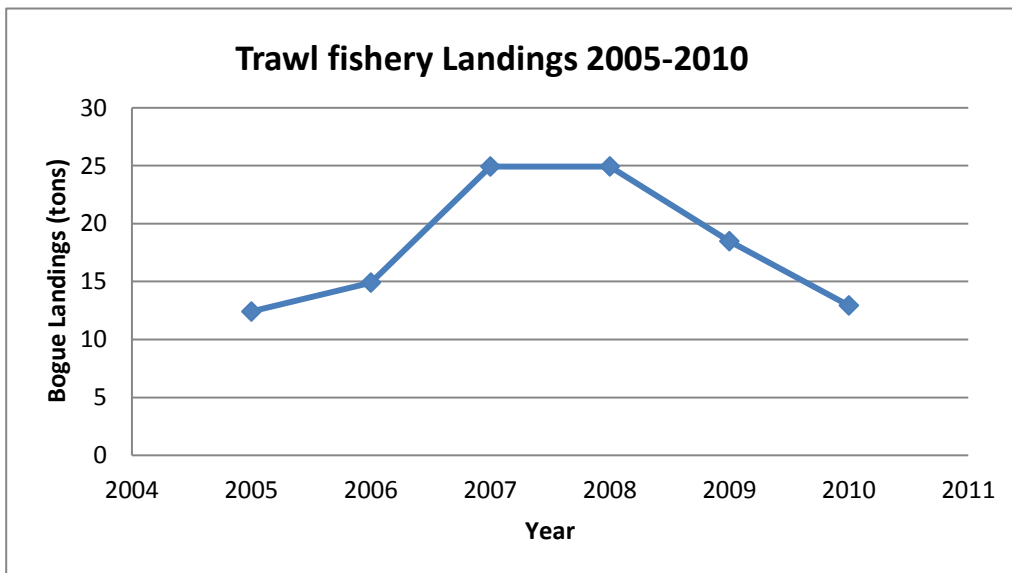

Fleet: Since 2006 the number of licensed bottom trawlers operating in GSA25 has been reduced by 50% (from 8 to 4).

Catch: For both operational units, catch refers to the average values of the years 2005-2007 and 2008-2010.

Discards from the bottom trawl were evaluated for the first time in 2006, through a pilot study under the 2006 Cyprus National Fisheries Data Collection Programme. The discard estimates of *B.boops* for 2006 and 2007 were less than 200kg, accounting for about 0.4% of the total catch of the species. The percentage showed a significant increase for 2008 with 3%, while until 2010 has decreased to 1.2%.

Discards from the artisanal fishery are considered negligible.

Regulations in force and degree of observance of regulations

Restriction of the maximum number of licenses. Since 2008 assignment of licensed fishermen in 3 categories (A, B, C), based on their fishing activity and certain criteria. Licenses A&B restricted to 500. The restriction of licenses is fully observed.

Restrictions on the use of fishing gears depending on the fishing license category.

- For licenses A & B:

Minimum mesh size of nets at 32mm (open mesh size): fully observed. In the near future the minimum mesh size will be set at 36mm.

Maximum length of nets: For boats with license A is 5000m, for boats with license B is 3000m. Fully observed.

Restriction on the use of monofilament nets: Maximum length at 2400 m, allowable range of mesh size (open mesh size) 34 - 50 mm. Fully observed.

Maximum height of nets: 4m. Fully observed.

Restrictions on the time and duration of fishing, depending on mesh sizes. Fully observed.

- For licenses C (not fully observed):

Minimum mesh size of nets at 36mm (open mesh size).

Prohibition of the use of monofilament nets.

Maximum length of nets: 600 m.

Restriction of number of fishing days at 70 days annually, during weekends of certain months.

Regulations in force and degree of observance of regulations

Maximum number of licenses restricted to 4 (since 2006): fully observed.

Closed trawling period from 1st of June until the 7th of November (in force since the mid '80s) : fully observed.

Minimum mesh size of trawl net at 40mm (diamond shape) : fully observed. From 1st of June 2010 the 40mm diamond shape trawl net will be replaced by a square meshed net of 40mm or by a diamond meshed net of 50mm at the cod-end.

Prohibition of bottom trawling at depths less than 50m and at distances less than 0.7 nautical miles off the coast. From November 2008 there is a prohibition of bottom trawling at distances between 0.7 and 1.5 nautical miles in certain areas within the territorial waters. Fully observed.

Stock Status* Use one (or both) of the following two systems for the stock assessment status description

Unidimensional	<input type="radio"/>	? - (or blank) Not known or uncertain. Not much information is available to make a judgment;
	<input type="radio"/>	U - Underexploited, undeveloped or new fishery. Believed to have a significant potential for expansion in total production;
	<input type="radio"/>	M - Moderately exploited, exploited with a low level of fishing effort. Believed to have some limited potential for expansion in total production;
	<input type="radio"/>	F - Fully exploited. The fishery is operating at or close to an optimal yield level, with no expected room for further expansion;
	<input type="radio"/>	O - Overexploited. The fishery is being exploited at above a level which is believed to be sustainable in the long term, with no potential room for further expansion and a higher risk of stock depletion/collapse;
	<input type="radio"/>	D - Depleted. Catches are well below historical levels, irrespective of the amount of fishing effort exerted;
	<input type="radio"/>	R - Recovering. Catches are again increasing after having been depleted or a collapse from a previous;

Bidimensional	Exploitation rate		Stock abundance	
	<input type="radio"/>	No or low fishing	<input type="radio"/>	Virgin or high abundance
	<input type="radio"/>	Moderate fishing	<input checked="" type="radio"/>	Intermediate abundance
	<input checked="" type="radio"/>	High fishing mortality	<input type="radio"/>	Low abundance
	<input type="radio"/>	Uncertain / Not assessed	<input type="radio"/>	Depleted
			<input type="radio"/>	Uncertain / Not assessed

Comments

The estimated F current (0,57) in relation to the reference points Fmax (0.38) and F0.1 (0.24) for the first period (2005-2007), suggest an overfishing state of the stock. The mean stock biomass (420.57 tons) in relation to the virgin biomass (1941.48 tons) [21.7%] suggest an intermediate abundance of the stock.

For the second period (2008-2010), the F current (0,37) in relation to the reference points Fmax (0,39) and F0.1 (0.24) showed the stock is in overfishing state once more but in better situation as the current Y/R is very close to the maximum Y/R. The mean stock biomass (659.3 tons) in relation to the virgin biomass (2392.38 tons)[27.5%] indicated that the abundance of the stock remains intermediate with a higher percentage though.

It is obvious that artisanal fishery using gillnets, puts the most pressure on the stock of bogue.

SAC GFCM - Sub-Committee on Stock Assessment (SCSA)

Assessment form

Sheet Z

Objectives and recommendations

Code: BOG2511Mar

Management advice and recommendations*

Fishing pressure should be reduced in the case of small scale fisheries. According to transition analysis, a reduction of approximate 15% (10-20%) of current F value would lead to the F0.1 in two years assuming a constant recruitment. This could be achieved with the reduction of licensed fishing boats (OAL: 6-12 m).

Also an important management measure that could lead to this goal is the increase of the minimum mesh size from 32 mm to 38 mm since 10th of March 2011.

It is noteworthy to mention that for the bottom trawl fishery, there was a replacement of the 40mm diamond shape trawl net by a diamond meshed net of 50mm at the cod end from 1st of June 2010, and also that the licensed bottom trawlers have been recently reduced at 50% (from 4 to 2). A further reduction of bottom trawlers operating in territorial waters remains a priority in the fishery policy of the Government within the Operational Program for fisheries 2007-2013.

Advice for scientific research*

Re-evaluation of the growth parameters of the species from the Von-Bertalanffy growth equation. Estimation of SSB using maturity data and development of stock-recruit models. Use of other methods that do not require equilibrium assumption (steady state) made by the VIT model.

Geographical Sub-Area

Fisheries (brief description of the fishery)*

Bogue (Boops boops) in GSA 25 is exploited mainly by the artisanal fleet that consists 500 vessels OAL 6-12m using gill nets and secondly by the bottom otter trawlers that consist 4 vessels OAL 12-24m since 2006. The main species caught with bogue in gillnets are: Spicara smaris, Spicara maena and Sardina pilchardus, while in bottom trawl are: Spicara smaris, Mullus surmuletus, Mullus barbatus, Pagellus erythrinus and cephalopods (Octopus vulgaris, Loligo vulgaris and Sepia officinalis). The percentage of bogue in the overall landings for artisanal fishery, for the period 2005-2010, has a range 20-28.7% while for bottom trawl fishery is 5.7-9.4%. Both gears exploit mostly age classes 3 and 4.

Source of management advice*

(brief description of material -data- and methods used for the assessment)

Methods used:
The present assessment was performed by means of VPA analysis, using a pseudo-cohort from catch-at-age data for two three-year periods (2005-2007 and 2008-2010). For both periods, Yield per Recruit (Y/R) Analysis was also performed. The VIT software (Leonart and Salat, 1997) was used for both analyses.

Due to the fact that the VIT model using one year recommends a very strong equilibrium state, it has been suggested by the previous Working Group on stock assessment of Demersal species, (Istanbul 18-23 October, 2010), to use the means of values for three years in order to record any changes of the level of the stock by splitting the time series.

Data used:
Catch-at-age data derived from landings for each fishing gear exploiting the stock (gill net and bottom trawl), and discards data from bottom trawl. A combined ALK for 2006-2008 and annual length distributions from 2005-2010 were used.

M vector for each age class was used, estimated by PRODBIOM (Abella et al., 1997).

The biological parameters used (growth parameters and L-W relationship) were estimated within the framework of the Cyprus National Data Collection Programme.
